

Race Manager — Backing Up Your Results

Sep 30, 2026 · [Tamiya Race Manager on GitHub](#)

There are three copies of your club's results. Two happen by themselves. One takes a single click at the end of race night, and it is the one that matters most.

Do this every race night

Plug in a USB stick and click  Backup to USB, next to Export Data.

That is the whole job. One click. The app finds the stick itself — there is no Save dialog to work through and nothing to name.

After the first time you back up to a particular stick, the app remembers it and tops it up by itself whenever that stick is plugged in as you close down. Pressing the button again does no harm.

Only sticks you have used before are written to, so plugging in a phone or a camera card is safe.

The three copies

Copy	Where	Happens	Protects against
Race night archive	C:\Tamiya\Backup_DB	By itself, every time the app closes	A bad import, a wrong edit, a mistake you want to undo
USB stick	Wherever you keep it	You, one click	The computer dying
Rolling backups	%LOCALAPPDATA%\TamiyaRaceManager\backups	By itself, kept 14 days	Something going wrong in the last fortnight

About the race night archive. A new file appears only when something has actually changed, so opening and closing the app without racing adds nothing. Every file in that folder is a real race night, named by date and time — `racedata-2026-09-26-2118.json` is 26 September at 9:18pm. Nothing there is ever deleted.

It also saves when the app *starts*, so a flat battery or a Windows restart cannot lose a night's racing.

Going back to an earlier night

1. Open Race Manager.
2. Click **Export Data** first, so you can undo the undo.
3. Click **Import Data** and pick the file you want — from `C:\Tamiya\Backup_DB` or from the stick.
4. Confirm.

The app is now exactly as it was at that date and time.

Importing **replaces everything**, so if you have raced since that file was saved, those results will go. That is what step 2 is for.

Why the USB copy matters most

The race night archive sits on the same disk as the app. If the machine itself fails, that folder fails with it.

On a laptop or tablet where the storage is soldered to the board, a dead machine cannot be opened up and the drive cannot be read. Everything on it is gone.

So of the three copies, only the USB stick survives losing the computer. It is also the only one that needs a person.

Keep a stick, and keep it somewhere other than the laptop bag. If the bag is lost or stolen, a stick inside it is no help.

A season is a few megabytes. Any stick will do.
